

From the work done I was able to see that thursday was the best day of the week to get retweets for the purpose of analysis, followed closely by tuesday then wednesday being the top 3 best day of the week to get the most tweets about the different dog breeds, the stage of the dog breed that is most voted for with high affinity given to the doggo puppo, followed by the puppo, then the floofer and the doggo stages respectively when compared against the ratings of these dog breeds.

However there was a different case when compared against the retweet count, as pupper led followed by doggo then puppo as the last 2 . It is safe to stay in the dog stages with the highest favourites being the doggo and puppo stages of the dogs development.

It was found that the golden retriever was the highest rated dog breed followed by the labrador then the Pembroke as the top 3 leading dog breeds. The week correlation between the p1 confidence and the favourite showed that the favorite location had little to no effect on the outcome of the confidence level regardless of the output it has in its column.

The dog stage with the highest retweet count was also explored with the Puper stage having the highest tweet count, this is followed by doggo stage although with a very large gap and puppo then floofer with some of the lowest tweet counts.
